APPLICATION SHEET

PTFE is well-known under the brand name Teflon which is used as a non-stick coating for pans. Like other fluoropolymers, PTFE has exceptionally high thermal and thermooxidative stability and is completely solvent resistant,

only certain fluorinated solvents dissolving it at temperatures near its melt temperature. It is also useful as a hightemperature and fire resistant electrical insulation material.

Instrument

DSC 204 F1 Phoenix®

Test Conditions

Heating rate Sample mass

Crucible

Temperature range -80°C ... 370°C ... -80°C ... 370°C 20 K/min Atmosphere Nitrogen at 20 ml/min 9.89 mg Al, pierced lid

Results

An endothermic peak with a shoulder was detected between 20°C and 50°C in both heating cycles. It is related to the crystal-crystal transitions of PTFE. The peak at 25°C is most probably due to the transition triclinic/hexagonal of the sample, the shoulder at 33°C to the transition hexagonal/pseudo-hexagonal. The peak at 336.1°C (first heating) / 332.9°C (second heating) can be attributed to melting of the PTFE.
